

Sarawak Parliament 1st Draft 2026 Redelineation

GeoJSON Boundary File — Dataset Metadata

Preview: 31 proposed Parliamentary constituency boundaries (SYOR 1), colours for visual distinction only.

Dataset Metadata

Field	Value
Title	Sarawak Parliament 1st Draft 2026 Redelineation (Low Resolution)
Description	Proposed boundaries of Sarawak's Parliamentary (Dewan Rakyat) constituencies under "1st Proposal" (SYOR 1) of the Election Commission of Malaysia's 2026 redelineation exercise — the spatial counterpart to the SYOR 1 Parliament attribute dataset.
Compiler / Publisher	TindakMalaysia Network Services PLT (civic data repository); primary source is the Election Commission of Malaysia (SPR) redelineation proposal
Geographic Coverage	State of Sarawak, Malaysia
Bounding Box (WGS84)	109.545°E – 115.683°E, 0.863°N – 4.994°N (identical extent to the DUN-level layers)
Coordinate Reference System	CRS84 (WGS 84, longitude/latitude — urn:ogc:def:crs:OGC:1.3:CRS84)
Geometry Type	MultiPolygon (all 31 features; 1 feature is multi-part, i.e. includes a separate exclave/island polygon)
Feature Count	31 features — one per proposed parliamentary constituency (matches the 31-row SYOR 1 Parliament CSV)
Vertex Count	~6,800 total vertices; ~220 per feature on average — generalized ("Low Resolution") rather than survey-grade
Advisable Scale of Use	1 : 600,000 — suitable for state-wide to sub-regional overview mapping; not intended for cadastral, parcel-level, or legal-boundary determination
File Format	GeoJSON (FeatureCollection), UTF-8
File Size	~299 KB
Process Stage	SYOR 1 — first-stage proposal, subject to public objection/inquiry before final gazettal
License	CC BY
Companion Datasets	SYOR 1 PROPOSAL - PROPOSED PARLIAMENTARY CONSTITUENCY.csv (attribute comparison) and the two DUN-level GeoJSONs (each DUN feature nests within one of these 31 parliamentary boundaries)

Attribute (Properties) Dictionary

Property	Type	Description
Id	Integer	Sequential feature identifier, range 192–222 (31 values, no duplicates or gaps).
NEGERI	String	State name; constant value SARAWAK.
KODPAR	String (code)	Proposed parliamentary constituency code, e.g. P.201.
PARLIMEN	String	Proposed parliamentary constituency name, e.g. BATANG LUPAR.
KODUNIK	String (code)	Unique identifier — identical to KODPAR at this administrative level (no compound code, since Parliament is the top tier; unlike the DUN files' KODPAR_KODDUN format).
BILANGAN_P	Integer	Number of electors (“Bilangan Pengundi”) under the proposed boundary — matches TOTAL ELECTORS (2026) in the companion CSV.
PERATUS_EQ	Decimal (%)	Percentage of the electoral quotient — this seat’s elector count as a percentage of the state-wide average elector count per seat. Ranges from 43.30% to 241.00% across the 31 proposed seats; 100% indicates parity with the average.

Geometry Notes

All boundaries are MultiPolygon, even for seats with a single contiguous shape. One of the 31 features contains more than one polygon part, indicating a constituency with a detached exclave or island area. Each parliamentary boundary here is the union of several DUN-level boundaries from the companion DUN GeoJSON — join on KODPAR (DUN file) = KODUNIK (this file) for cross-referencing. Vertex density per feature (~220) is higher than the DUN-level layers despite covering larger areas, since parliamentary boundaries still trace the same detailed coastline/river segments where they form the constituency edge. Coordinates are stored at double precision, but the file name and vertex density indicate this is a generalized/simplified (“Low Resolution”) version of the boundary, appropriate for the advised 1:600,000 mapping scale — not for high-precision measurement.
