

Sarawak DUN Pre-2026 Redelineation

GeoJSON Boundary File (Baseline) — Dataset Metadata

Preview: 82 existing (pre-redelineation) DUN constituency boundaries, colours for visual distinction only.

Dataset Metadata

Field	Value
Title	Sarawak DUN Pre-2026 Redelineation (Low Resolution)
Description	Existing (pre-redelineation) boundaries of Sarawak's State Legislative Assembly (DUN) constituencies, as they stood before the Election Commission of Malaysia's 2026 redelineation exercise for Sarawak — the “before” baseline layer that the SYOR 1 proposed-boundary GeoJSON is compared against.
Compiler / Publisher	TindakMalaysia Network Services PLT (civic data repository); primary source is the Election Commission of Malaysia (SPR)
Geographic Coverage	State of Sarawak, Malaysia
Bounding Box (WGS84)	109.545°E – 115.683°E, 0.863°N – 4.994°N (identical extent to the proposed-boundary layer)
Coordinate Reference System	CRS84 (WGS 84, longitude/latitude — urn:ogc:def:crs:OGC:1.3:CRS84)
Geometry Type	MultiPolygon (all 82 features; 3 features are multi-part, i.e. include separate exclave/island polygons)
Feature Count	82 features — one per existing DUN constituency (matches the 82 pre-redelineation seats referenced in the SYOR 1 DUN CSV)
Vertex Count	~9,600 total vertices; ~117 per feature on average — generalized (“Low Resolution”) rather than survey-grade
Advisable Scale of Use	1 : 600,000 — suitable for state-wide to sub-regional overview mapping; not intended for cadastral, parcel-level, or legal-boundary determination
File Format	GeoJSON (FeatureCollection), UTF-8
File Size	~434 KB
Process Stage	Baseline / “before” layer — reflects boundaries in force prior to the 2026 redelineation exercise
License	CC BY
Companion Datasets	SYOR 1 PROPOSAL - PROPOSED DUN CONSTITUENCY.csv (attribute comparison) and Sarawak_DUN_1st_Draft_2026_Redelineation_Low_Resolution.geojson (the proposed/“after” boundary layer)

Attribute (Properties) Dictionary

Property	Type	Description
Id	Integer	Sequential feature identifier, range 506–587. No duplicates or gaps found (unlike the proposed-boundary file, which has an Id data quality issue).
NEGERI	String	State name; constant value SARAWAK.
KODPAR	String (code)	Existing parent parliamentary constituency code, e.g. P. 193 (note the internal space — differs from the proposed layer's P.193).
PARLIMEN	String	Existing parent parliamentary constituency name, e.g. SANTUBONG.
KODDUN	String (code)	Existing DUN seat code, e.g. N. 03 (note the internal space).
NAMADUN	String	Existing DUN seat name, e.g. TANJONG DATU.
KODUNIK	String (code)	Combined unique identifier (KODPAR + KODDUN), e.g. P. 193_N. 03. Whitespace differs from UNIQUE CODE (2022) in the companion CSV (P.193_N.03) — normalize before joining.
BILANGAN_P	Integer	Number of electors (“Bilangan Pengundi”) under the existing boundary.
PERATUS_EQ	Decimal (%)	Percentage of the electoral quotient — this seat’s elector count as a percentage of the state-wide average elector count per seat. Ranges from 42.18% to 299.81% across the 82 existing seats — a much wider spread than the proposed layer’s 50.39–167.84%, illustrating the malapportionment the redelineation exercise aims to reduce.

Geometry Notes

All boundaries are MultiPolygon, even for seats with a single contiguous shape. Three of the 82 features contain more than one polygon part (detached exclave/island areas) — one more than the proposed layer’s two, consistent with some boundary consolidation during redelineation. Coordinates are stored at double precision, but the file name and vertex density indicate this is a generalized/simplified (“Low Resolution”) version of the boundary, appropriate for the advised 1:600,000 mapping scale — not for high-precision measurement.
